

The 1099 your software won't find

It is the second week of January. The client's books are clean, the software's 1099 report is printed, and the plumber is not on it. Rivera Plumbing was paid three times in 2026: $700 in January, $800 in April, $900 in October. Someone typed the name three different ways, and nobody ticked the box that tells the software to track that vendor for 1099.

Rivera Plumbing is invented. It lives in one of our test files. The way it slips through is not invented: Intuit keeps a help page on fixing missing contractors and wrong 1099 amounts. This article is about a free tool that catches it, and it opens a series. Each episode takes one step of an accounting process and builds a tool that works alongside the software accountants already have. We start with Procure-to-Pay, because 1099s are due February 1, 2027, and because this is the first season under a new number.

The number changed. The habit didn't.

For payments made in 2026, the general limit for Forms 1099-NEC and 1099-MISC is $2,000, not $600 (IRS instructions, 12/2026). The IRS expects the change to matter: it projects Forms 1099-NEC falling from 68.9 million in 2026 to 56.7 million in 2027

(Publication 6961). Getting it wrong costs $60 to $340 per form for returns due in 2027, and $690 for intentional disregard (IRS).

The work itself has not changed. On write-up software with no 1099 report, one accountant described it plainly: "We print out the GL for the year or YTD and manually search the transactions for Vendors eligible for 1099's" (Intuit Accountants Community).

The gap between the apps

Accountants do not need another app. The 2026 Intuit QuickBooks Accountant Technology Survey of 725 professionals found the average firm already runs on about 10. It also found they lose about five hours a week "moving, re-entering, or reconciling data across disconnected systems."

That is where these tools go: into the gap. QuickBooks Online and Xero both have a 1099 report, and both leave out card payments on their own. But each counts only the vendors someone flagged for 1099. QuickBooks also needs the payment account mapped to a 1099 box. A vendor nobody flagged is invisible.

IN ADDITION TO WHAT YOU HAVE

Your software's 1099 report, and what this adds

Your accounting software's 1099 report

QuickBooks Online and Xero

- ✓ Counts vendors someone flagged for 1099
- ✓ Counts payments from accounts mapped to a 1099 box (QuickBooks) or matching your 1099 rules (Xero)
- ✓ Leaves out card payments
- ✓ Feeds your filing service

Also checked by this tool

From the year's payments, exported from any ledger

- \+ **Every payment, flagged or not**
- \+ One vendor typed several ways
- \+ A check entered twice
- \+ A refund that pulls a vendor under the limit
- \+ Law firms and medical providers that are incorporated
- \+ Whether the file adds up to its own totals
- \+ A reason for every vendor, on a workpaper you sign

Use both. **A vendor on this list and not on your software's list was probably never flagged.**

Software column: QuickBooks Online and Xero help pages, November 2026. The tool reads a CSV or Excel export, on your computer; nothing is uploaded.

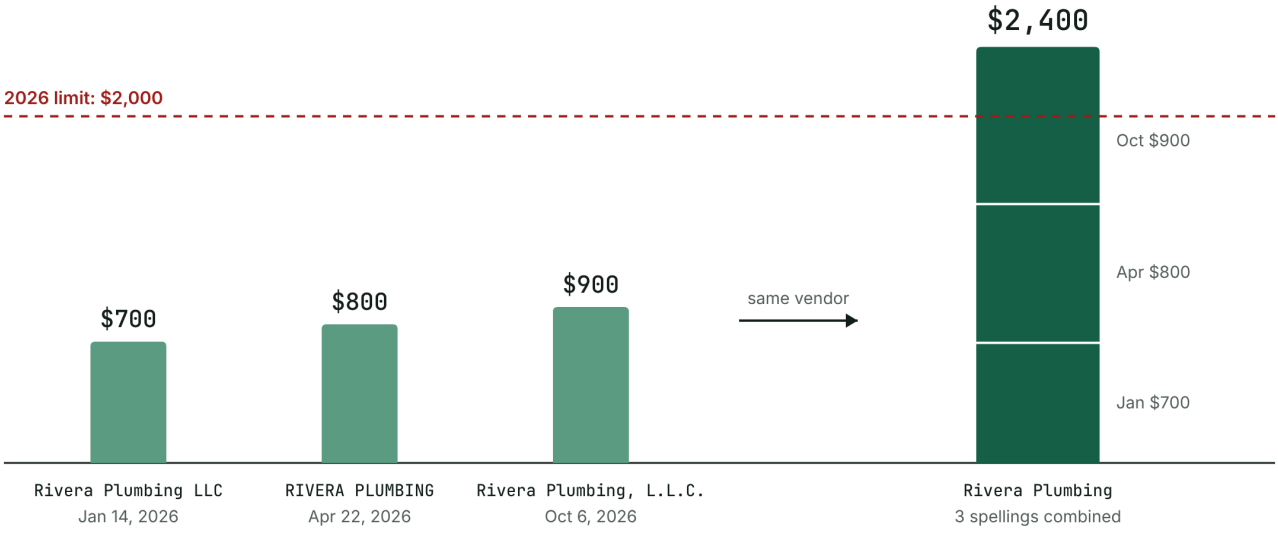

Three checks, one vendor

The tool is one web page. The accountant exports the client's payments for the year from whatever ledger the client uses, drops the file in, and gets back a worksheet. It reads every payment, flagged or not. It treats "Rivera Plumbing LLC", "RIVERA PLUMBING" and "Rivera Plumbing, L.L.C." as one vendor, adds them in code, and finds $2,400.

WHAT THE TOOL SEES

One plumber, three spellings

Each check on its own is far under this year's $2,000 limit. Typed three ways, the vendor never adds up, so no 1099 is issued. Combined, it is over.

Seen separately: no 1099
The software's report misses all three if none is flagged for 1099.

Seen together: file a 1099-NEC
The tool merges the spellings and shows the rows.

Payments to Rivera Plumbing in test file 04 (Larkspur Cafe). Both companies are invented. Limit: IRS Instructions for Forms 1099-MISC and 1099-NEC (12/2026), payments made in 2026.

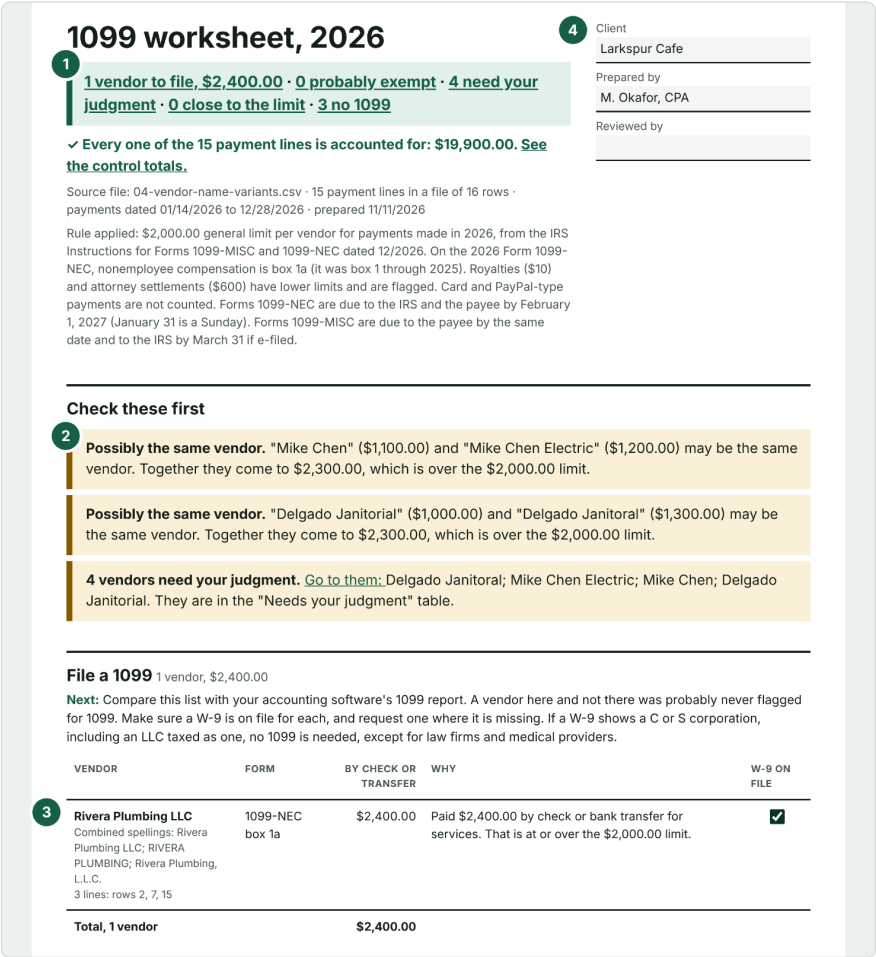

It is careful about what it merges. The same test file pays "Mike Chen" $1,100 and "Mike Chen Electric" $1,200. The tool does not decide those are the same person. It lists them under "Check these first" and says that together they come to $2,300. "Smith Electric" and "Smith Roofing" it leaves alone.

Every vendor lands in exactly one list: file a 1099, probably exempt, needs your judgment, close to the limit, or no 1099. Each one comes with a sentence saying why. The worksheet prints with her name on it and the W-9 boxes ticked. Nothing leaves her computer, and no

AI runs when she uses it. An AI wrote the page; what runs is ordinary code, so the same file always gives the same answer.

WHAT COMES BACK

A worksheet to sign, not a black box

1099 worksheet, 2026

1 vendor to file, $2,400.00 · 0 probably exempt · 4 need your judgment · 0 close to the limit · 3 no 1099

✓ Every one of the 15 payment lines is accounted for: $19,900.00. See the control totals.

Source file: 04-vendor-name-variants.csv · 15 payment lines in a file of 16 rows · payments dated 01/14/2026 to 12/28/2026 · prepared 11/11/2026

Rule applied: $2,000.00 general limit per vendor for payments made in 2026, from the IRS Instructions for Forms 1099-MISC and 1099-NEC dated 12/2026. On the 2026 Form 1099-NEC, nonemployee compensation is box 1a (it was box 1 through 2025). Royalties ($10) and attorney settlements ($600) have lower limits and are flagged. Card and PayPal-type payments are not counted. Forms 1099-NEC are due to the IRS and the payee by February 1, 2027 (January 31 is a Sunday). Forms 1099-MISC are due to the payee by the same date and to the IRS by March 31 if e-filed.

Check these first

Possibly the same vendor. "Mike Chen" ($1,100.00) and "Mike Chen Electric" ($1,200.00) may be the same vendor. Together they come to $2,300.00, which is over the $2,000.00 limit.

Possibly the same vendor. "Delgado Janitorial" ($1,000.00) and "Delgado Janitoral" ($1,300.00) may be the same vendor. Together they come to $2,300.00, which is over the $2,000.00 limit.

4 vendors need your judgment. Go to them: Delgado Janitoral; Mike Chen Electric; Mike Chen; Delgado Janitorial. They are in the "Needs your judgment" table.

File a 1099 1 vendor, $2,400.00

Next: Compare this list with your accounting software's 1099 report. A vendor here and not there was probably never flagged for 1099. Make sure a W-9 is on file for each, and request one where it is missing. If a W-9 shows a C or S corporation, including an LLC taxed as one, no 1099 is needed, except for law firms and medical providers.

VENDOR	FORM	BY CHECK OR TRANSFER	WHY	W-9 ON FILE
Rivera Plumbing LLC Combined spellings: Rivera Plumbing LLC; RIVERA PLUMBING; Rivera Plumbing, L.L.C. 3 lines: rows 2, 7, 15	1099-NEC box 1a	$2,400.00	Paid $2,400.00 by check or bank transfer for services. That is at or over the $2,000.00 limit.	☑
Total, 1 vendor		$2,400.00		

1 **The answer first.** How many vendors to file and the total, linked to each list.

2 **Check these first.** Names that look alike but that it will not merge on its own. You decide.

3 **Every vendor has a reason.** The form and box, the amount, the spellings it combined, and the file rows behind it.

4 **Type, tick, print.** Your name, the W-9 boxes and your decisions print with it.

Screenshot of the tool on test file 04 (Larkspur Cafe, an invented client). Cropped; the full worksheet continues with control totals and the vendors that get no 1099.

We tried to break it

We wrote the test before the tool: 15 files, 510 payment lines, 99 vendors, each answer worked out by hand from the IRS instructions. Five files hide planted errors, among them a check entered twice, a subtotal that does not match its lines, and last December's payments mixed into this year. The final version passes all 476 checks and catches all five errors.

Getting there was not tidy. A separate AI session, told to play a skeptical tax reviewer, found that we had the box number wrong: on the 2026 Form 1099-NEC, nonemployee compensation moved to box 1a. Another, told to play a 60-year-old partner with no patience for software, typed her client's name into a line that only looked like a box. She also found the list of who gets a 1099 sitting below the fold. Both were fixed.

The best catch came last. To prove the tests could fail, we broke the tool on purpose, five ways. All five broken copies passed. The tests were fine; our test runner had been testing the wrong file. Once that was fixed, all five failed, as they should.

THE TEST CAME FIRST

We tried to break it

15
test files written before the tool, answers worked by hand from the IRS instructions

476 / 476
checks passed by the final version: every vendor, form, amount and control total

5 / 5
planted errors caught, including a check entered twice and a file that does not add up

Then we broke the tool on purpose, five ways

A test that cannot fail proves nothing. The first time, all five broken copies passed. Our test runner had been checking the wrong file. We fixed it and ran them again.

BROKEN COPY	FIRST RUN	AFTER THE FIX
Uses the old $600 limit	× passed	✓ caught, failed 12 of 15 files
Counts card payments	× passed	✓ caught, failed 4 files
Treats every LLC as a corporation	× passed	✓ caught, failed 4 files
Counts bills as well as payments	× passed	✓ caught, failed 1 file
Stops merging spellings	× passed	✓ caught, failed 1 file

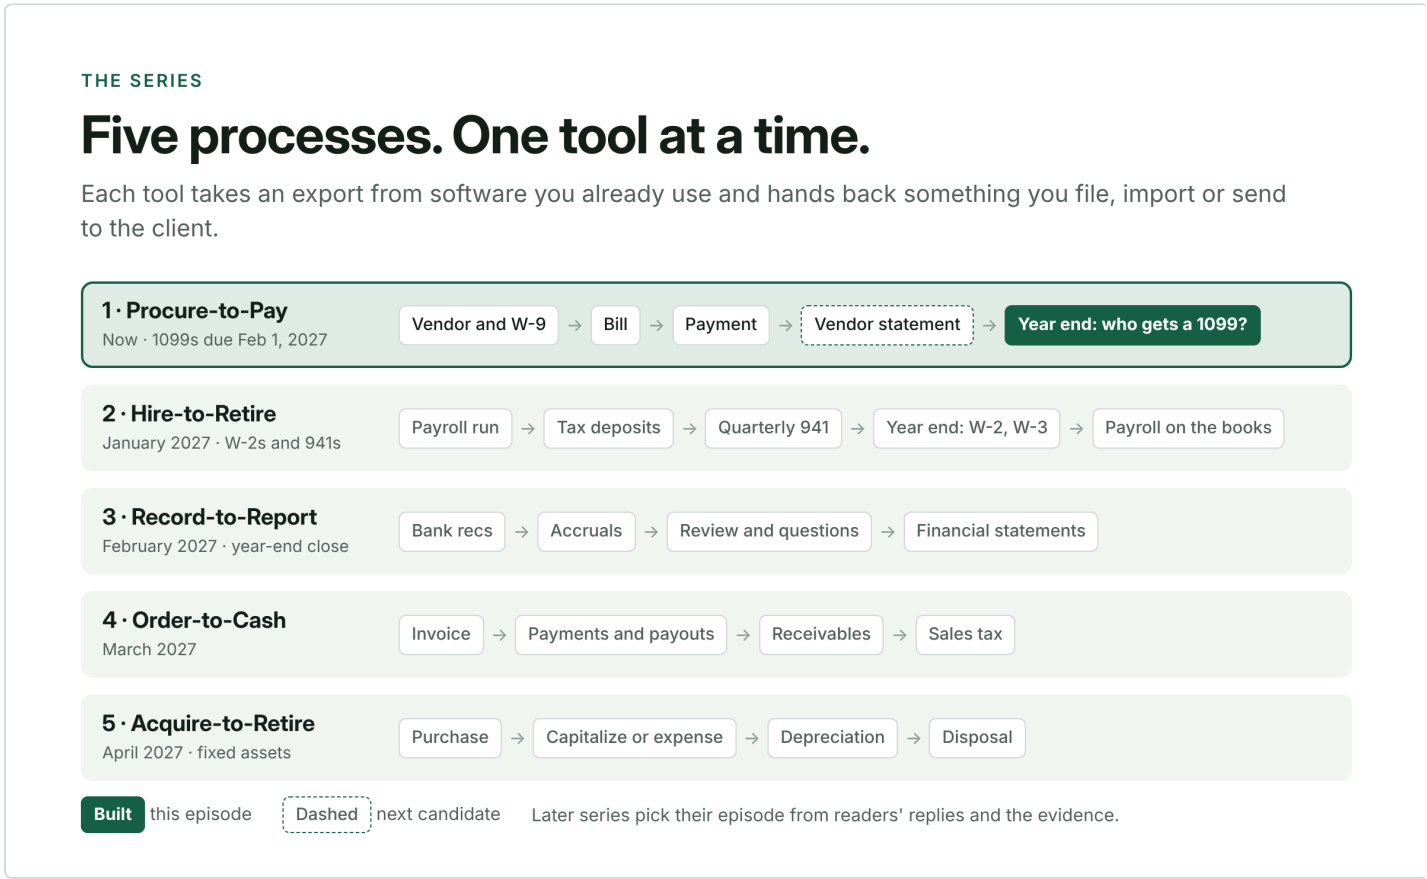

All figures from tests/RESULTS.md in the repository. Test files are invented; no client data.

How much time does it save? Reading the 518 lines in our test files by hand would take, by our estimate, about two hours. The tool reads them in about a second. That estimate is ours, not a measurement, and the judgment calls still take her time. A practicing accountant will time both in the next round.

What it won't do

It has not seen a W-9, so it cannot know that an LLC is taxed as a corporation. It does not check taxpayer ID numbers, state rules or backup withholding. It refuses 2027 files, because the 2027 limit has not been set. It judges what a payment was for from the account it was coded to and the vendor's name, so a contractor coded to Supplies lands in "no 1099". That list is printed with a reason for each vendor, so the accountant can skim it.

The series

The series follows the five processes accountants run for clients: Procure-to-Pay, Hire-to-Retire, Record-to-Report, Order-to-Cash and Acquire-to-Retire. Each starts in the season its work peaks. Payroll is next, in January, when the W-2s and the fourth-quarter 941 land on the same desk.

Every tool comes with its test files, its results, and one prompt that rebuilds it from nothing. A fresh AI session, given only that prompt, built a page that passed the same 476 checks on its first try. "The same tool" here means it passes the same tests; the code is

different. The prompt is below. The repository link is in the first comment under this post.

Your turn

Which step in those five processes still eats your afternoon? Tell me the step, the document it starts from, and how many minutes it takes. The next episodes come from the replies.

Appendix: the rebuild prompt, in full

```
Build a single self-contained HTML file called `who-gets-a-1099.html`. It is a tool for a US
accountant who is expert in tax, impatient with software, and working on a desktop. She gives it one
file, the list of everything a client paid during the year, and gets back a printable worksheet
saying which vendors need a Form 1099, whose W-9 to check, and why. Everything runs in the browser.
Nothing is uploaded. Do all arithmetic in whole cents, in code.

## Screen
- Start screen: the title "Who gets a 1099?", one sentence saying what it does, and one large drop
area ("Drop the client's payments file here, or click to choose it") wrapping an `<input
type="file">` for .csv and .xlsx. Under it, in a few short lines: what it adds (accounting
software's 1099 reports count only vendors someone flagged for 1099; this reads every payment, so it
also finds vendors nobody flagged, one vendor typed several ways, and checks entered twice), which
file to bring (all payments for the tax year, one line per check or charge), which rule applies
($2,000 for 2026 payments, $600 for 2025 and earlier), that the file never leaves the computer, and
that the result is a worksheet she must review. No settings. The only other control is a small link
that runs a built-in made-up sample.
- After a file is read, replace the start screen with the worksheet, one main button "Print or save
as PDF" (`window.print()`), and a small "Start over" link. Add print styles: compact type, table
headers repeated, a running page header with the file name and page numbers.
- Large type (18px or more), plain words, high contrast, light background. Stack table rows as cards
on a phone.
- Read .csv with your own parser (quoted fields, commas inside quotes, a leading BOM, blank lines,
CRLF). Read .xlsx with SheetJS from
`https://cdnjs.cloudflare.com/ajax/libs/xlsx/0.18.5/xlsx.full.min.js`, first sheet, raw cell values.
Excel dates arrive as serial numbers (days since 1899-12-30): treat a number between 20000 and 80000
in the date column as a date.
- If the file cannot be used, stay on the start screen and show "I could not use that file." with
the reason in plain words, directly under the drop area.

## Reading the file
All keyword matching below is on whole words, after lower-casing, deleting periods and apostrophes,
and turning `&` into "and" and other punctuation into spaces.

1. Header row: the first of the top 40 rows with a date heading and an amount heading.
   - Date: date, transaction date, txn date, payment date, check date.
   - Amount: one column (amount, paid amount, total), or a debit and a credit column, or a
```

```
payment/withdrawal column with an optional deposit column (payment minus deposit).
   - Payee: name, payee, vendor, vendor name, paid to, supplier. If none exists, use a column headed "description".
   - Optional: type (type, transaction type); number (num, no, number, check #, check no, check number, ref, reference); memo (memo, memo/description, description, notes); paying account (bank account, paid from, payment account); expense category (category, expense account).
   - A column headed "account" or "split" can be either. If more than half of its values on dated rows contain checking, savings, bank, cash, card, visa, mastercard, amex, discover or paypal, it is the paying account. Otherwise it is the expense category.
2. If there is no payee column, the file is grouped by vendor: a row with text in only one cell, no date and no amount is a vendor name for the lines under it.
3. A line is a row below the header with a readable date and a readable amount. Amounts may look like `1200`, `$1,200.00`, `(450.00)` (negative), `300.00-` (negative), `-550.00`. Dates may look like `1/5/26`, `01/19/2026`, `2026-02-14`, `Mar 3, 2026`. Two-digit years are 20xx. Keep each line's row number as it appears in the file, counting from 1 and counting title and blank rows. A line with a blank payee belongs to a vendor named exactly `(no name)`.
4. A row with a date but no readable amount is an unreadable line. It goes in no total. Remember which vendor it belonged to.
5. A row with no date whose first text is "Total", "TOTAL" or "Grand Total" is the file's own total. A row with no date whose first text starts with "Total " (such as "Total for Rivera Plumbing") is a vendor subtotal.
6. If there is a type column, the type decides what a line is:
   - Not a payment, never counted: the type is exactly bill, vendor credit, credit, purchase order, item receipt, journal entry, general journal or credit memo. Keep these lines aside.
   - Type contains "bill payment" or "bill pmt": a payment of the absolute value of the amount, whatever its sign.
   - Type contains refund, deposit or credit card credit: a refund, so minus the absolute value.
7. For all other lines, whichever sign most of them have is "a payment" and the opposite sign is a refund. With debit and credit columns, use debit minus credit as the written amount first. Payments are positive from here on.
8. Tax year: the year most payment lines fall in. Payment lines in another year are left out of every vendor and reported. If the tax year is after 2026, stop: this version only knows the rules through 2026 and must not guess.
9. Dollar limit: $2,000 for 2026 payments, $600 for 2025 and earlier. A vendor exactly at the limit counts.

## Vendors
- Vendor key: the matching form of the name, with these words dropped: llc, inc, incorporated, corp, corporation, co, company, ltd, pllc, pc, lp, llp, the, and. Names with the same key are one vendor. Its name is the most common spelling. Show every spelling that was combined.
- "Looks incorporated": the name contains inc, incorporated, corp, corporation or pc. LLC, LLP, PLLC, Ltd and Co say nothing about tax status.
- Payment method of each line:
  - network: the type, paying account or number contains paypal, venmo, stripe, square or cash app, or the memo contains paypal, venmo or cash app;
  - card: the type, paying account or number contains card, ccard, visa, mastercard, amex, american express, discover or pos;
  - bank: everything else (check, ACH, wire, Zelle, cash, unknown).
- For each vendor: R = net bank dollars, C = card, N = network, T = R + C + N, all for the tax year.
- Kind of each line, from its expense category:
  - X (not a vendor payment): payroll, wages, salary, salaries, tax, taxes, owner, owners, draw, distribution, transfer, loan, credit card payment, interest, bank fees, insurance, license, licenses, permit, permits;
  - R (rent): rent, rental, lease;
  - S (service): contract, contractor, subcontractor, subcontractors, labor, outside services,
```

```
professional, consulting, repair, repairs, maintenance, janitorial, cleaning, landscaping,
commission, commissions, marketing, advertising, accounting, bookkeeping, design, security,
training, legal, preparation, service, services;
  - G (goods): supplies, supply, materials, inventory, cost of goods, purchases, merchandise,
equipment, tools, furniture, fuel, utilities, telephone, internet, freight, shipping, postage,
storage, meals, travel, software, subscription, subscriptions, dues, parts, food.
  - Decide in this order: X if it matches X and not S; else R if it matches R; else S if S and not
G; else G if G and not S; else unknown.
  - If the category is "accounts payable" (a bill payment), take the kind from that vendor's set-
aside bill lines: the kind with the most bill dollars. Those bill lines' categories and memos also
count in every category or memo test below.
  - If there is no category, or it is accounts payable with no bills, use the vendor name: R for
realty, properties, leasing; S for plumbing, electric, hvac, roofing, landscaping, cleaning,
janitorial, consulting, design, photography, repair, construction, carpentry, painting, bookkeeping,
accounting, cpa, marketing, staffing, towing, upholstery, service, services; G for supply, supplies,
hardware, lumber, wholesale, distributor, distributors, utility, utilities, power, energy, water,
and big retailers and carriers (Amazon, Home Depot, Staples, Office Depot, Costco, Walmart, FedEx,
UPS, Verizon, Comcast). If both S and G words match, or neither, it is unknown.
- Kind of the vendor, first match wins:
  1. EXCLUDED if the name contains irs, internal revenue, treasury, department of, state of, city
of, franchise tax, gusto, adp, paychex, card services, bank, credit union, insurance or state farm.
  2. ATTORNEY if the name contains law, attorney, attorneys, lawyer, esq or legal, or a category
contains "legal" without "professional".
  3. MEDICAL if the name contains md, dds, dmd, medical, clinic, dental, chiropractic, physician,
health or hospital, or a category contains medical, dental or health care without supplies or
insurance.
  4. Exception to 2 and 3: if the name matched but the vendor's goods-category dollars are more than
all its other dollars together, the kind is unknown, and the reason must say the name and the books
disagree.
  5. MIXED if its bank dollars include both S and G lines.
  6. Otherwise the kind with the most dollars, all methods (S service, R rent, G goods, X excluded,
unknown).

## One bucket per vendor, first match wins
1. The `(no name)` vendor: `REVIEW`.
2. EXCLUDED: `NOT_REPORTABLE`. Give the specific reason (payroll, taxes or government, insurance,
owner draw, loan or interest, transfer or bank).
3. T is zero or less: `NOT_REPORTABLE` (refunds, credits or deposits only).
4. A category or memo mentions royalty or royalties and R is $10 or more: `REVIEW` (royalties go on
1099-MISC box 2 from $10).
5. Goods: `NOT_REPORTABLE`.
6. One of the vendor's rows is an unreadable line: `REVIEW` (its true total is unknown).
7. Its bank dollars include both rent lines and service lines, R reaches the limit, and it is not
ATTORNEY or MEDICAL: `REVIEW` (two different forms).
8. MIXED where service bank dollars are under the limit but service plus goods bank dollars reach
it: `REVIEW`. If service dollars alone reach the limit, treat it as a service vendor, report all of
R, and add a caution that the amount includes goods.
9. R at or over the limit:
   a. R minus possible duplicates (see checks) falls under the limit: `REVIEW`.
   b. ATTORNEY: `NEC`, even if incorporated. If a memo or category mentions "settlement": `REVIEW`.
   c. MEDICAL: `MISC_MEDICAL`, even if incorporated. Say tax-exempt and government hospitals are
excepted.
   d. Looks incorporated: `CONFIRM_CORP` (probably exempt; a W-9 showing C or S corporation settles
it). But if a category or memo of its lines contains legal, attorney or law: `REVIEW`, because law
firms are not exempt.
```

```
   e. Rent: `MISC_RENT`. Say it is not required when paid to a real estate agent or property
manager.
   f. Unknown: `REVIEW` (cannot tell what the payment was for).
   g. Service: `NEC`.
10. R under the limit:
   a. R plus the vendor's bank refunds (as a positive number) reaches the limit: `REVIEW` (under the
limit only because of refunds or credits).
   b. ATTORNEY and R is $600 or more: `REVIEW` (fees under the limit need no form, but settlement
money paid to an attorney goes on 1099-MISC box 10 from $600).
   c. N is more than zero and R + N reaches the limit: `REVIEW` (PayPal and Venmo payments count if
sent as personal payments).
   d. It is a look-alike of another vendor and together they reach the limit (see checks): `REVIEW`.
   e. R is at least 75% of the limit: `CLOSE`.
   f. Otherwise `NOT_REPORTABLE`. If T reaches the limit, say the card portion is why.
   For 2026 files, when R is between $600 and the limit in 10e or 10f, add a sentence telling her to
check whether her state still uses the $600 limit.

Form and box: `NEC` is form `1099-NEC`, box `1a` for 2026 payments and box `1` for 2025 and earlier.
`MISC_RENT` is `1099-MISC` box `1`. `MISC_MEDICAL` is `1099-MISC` box `6`. Every other bucket has
form and box null.

## Checks. Never fix silently; report.
Raise each as an exception with a code and a plain-English message that gives row numbers:
- `TOTAL_MISMATCH`: the file's own total differs from the sum of all its lines exactly as written
(set-aside bills included, signs as written; compare absolute values).
- `SUBTOTAL_MISMATCH`: in a grouped file, a vendor subtotal differs from the written sum of the
lines since the previous subtotal.
- `NOT_PAYMENTS`: lines set aside in step 6 of Reading the file, with a count by type.
- `UNREADABLE_LINES`, `OUTSIDE_YEAR`. In the outside-year message, name any vendor whose payments in
that other year reach that year's limit.
- `PARTIAL_YEAR`: the first payment in the tax year is after January 31 or the last is before
December 1.
- `DUPLICATE`, one per group: payment lines with the same vendor, date, amount and number (two blank
numbers count as the same). Keep every copy in the totals. Same date and amount with different
numbers is not a duplicate.
- `SAME_VENDOR`, one per pair: two vendors, neither goods nor excluded, whose keys look alike (every
word of one is in the other and a shared word has 4 or more letters, or the keys with spaces removed
are each 8 or more characters and within edit distance 2), where R of at least one is under the
limit and their combined R reaches it.
- `REFUND`: one exception listing the negative lines in the tax year that belong to a vendor who
also has a positive line. A payee with only money coming in is not a refund.

## Worksheet, in this order
1. Heading with the tax year. Directly under it, one line of counts that link to the sections:
vendors to file and their dollar total, probably exempt, needs judgment, close to the limit, no
1099. Then one line saying whether every payment line is accounted for and whether the file's own
total agrees. Then the source file name, the number of payment lines, the dates the payments run
from and to, the limit applied, and the due dates (1099-NEC to the IRS and the payee by January 31,
which is February 1 in 2027 because the 31st is a Sunday). For 2026 say that nonemployee
compensation is box 1a on the 2026 form and was box 1 before. Beside the heading, three text inputs
she can type in and that print: Client, Prepared by, Reviewed by. Keep Prepared by and Reviewed by
when she starts over with another file.
2. If the file's total or a subtotal does not tie: a large red warning in an element with `id="tie-
banner"` telling her not to file from this worksheet and to ask the client for a new export. Mark
the counts line "not confirmed" and repeat a short warning in the running header of every printed
```

page. No element with that id otherwise.
3. "Check these first": every exception, then the names of the `REVIEW` vendors, then any vendor in the first two tables that carries a caution. If there is nothing, say so. The `NOT_PAYMENTS` message lists each set-aside line with vendor, type, amount and row, and names any vendor that has bills but no payment in the file.
4. Tables in this order: File a 1099; Probably exempt; Needs your judgment; Close to the limit; No 1099. Under each heading, one sentence beginning "Next:" that says what to do. For File a 1099 it starts by telling her to compare the list with her accounting software's 1099 report, because a vendor here and not there was probably never flagged for 1099. Columns: vendor (with its row numbers as ranges), form and box, bank dollars, the reason as a full sentence that ends in a question when it is a judgment call, and a real checkbox "W-9 on file". In Needs your judgment, each row also has a multi-line text box "Your decision" that grows as she types and prints in full. Each table ends with a subtotal row.
5. Control totals: bank, card, network and outside-year dollars; their sum; the sum of the payment lines read and whether the two tie; the count of lines that were not payments; the file's own total and whether it ties to the lines as written (say in words why this can differ from the payments total). Then bank dollars for each table above, summing to the bank total.
6. A collapsed "Source lines" table listing every line of every vendor outside the No 1099 table: row, date, number, amount, counted or not, category, memo. It prints only while open.
7. Footer: what the tool does not do (it has seen no W-9; no TIN checks, state rules, backup withholding, 1099-INT/DIV/K or 1042-S; cannot spot an employee paid as a contractor or a tax-exempt payee; knows only the payments in the file; assumes a calendar-year client), and that the accountant is responsible for review.

Contract for testing
After each file, set `window.__report` to:
```
{ taxYear, threshold,                       // threshold in dollars: 2000 or 600
  controls: { linesRead, totalPayments, accountedFor, ties,
              byMethod: { bank, card, network }, outsideYearTotal, outsideYearLines,
              unreadableLines, notPaymentLines, fileTotal, fileTotalTies },
  exceptions: [ { code, message } ],
  vendors: [ { name, spellings: [..], bucket, form, box, reportable, card, network, total, why,
rows: [..] } ] }
```
Dollar values are numbers in dollars. `linesRead` counts payment lines only (not set-aside bills, not unreadable lines), including outside-year ones, and `totalPayments` is their sum. `outsideYearLines`, `unreadableLines` and `notPaymentLines` are counts. `accountedFor` is every vendor's `total` plus `outsideYearTotal`. `reportable` is R. `rows` are file row numbers. `form` and `box` are strings or null. `fileTotal` is positive, and it and `fileTotalTies` are null when the file has no total row.
If the file cannot be used, show no worksheet and set `window.__report = { fatal, message }`, with `fatal` equal to `NO_COLUMNS` (no date and amount headings, or no payment lines), `UNSUPPORTED_YEAR`, or `UNREADABLE_FILE` (wrong file type or a file that will not open).
